

Data Cleaning									
S.No	Column Name	Original Issue / Error	Action Taken & Formula Used						
	1 company_id	Completeness: Column was 100% blank (Null values).	Deleted the entire column as it provided no value for analysis.						
	2 Column1	Completeness: Garbage column created during scraping, 100% blank.	Deleted the entire column.						
	3 job_ID	Validity: Dataset contained 2,084 duplicate entries for the same job ID.	Removed duplicates using Data > Remove Duplicates. Retained only unique job postings (~5,843 rows).						
	4 linkedin_followers	Validity: Numeric data stored as text with commas and strings (e.g., "5,395,547 followers").	Used Find & Replace (Ctrl+H) to remove " followers" and commas .. Converted column format to Number.						
	5 job (Job Title)	Dirty Data: Titles contained extra info like salary, remote status, and special characters (e.g., "Data Analyst (Remote) - \$60k").	Created Clean_Job_Title using formula: `=PROPER(TRIM(REGEXREPLACE(B2, "[! (\$).*")						
	6 company_name	Consistency: Inconsistent capitalization (e.g., "google" vs "Google").	Standardized using helper column formula =PROPER(TRIM(E2)) and pasted values back to overwrite original.						
	7 full_time_remote	Validity: Two distinct variables (Type & Level) combined in one cell (e.g., "Full-time · Associate").	Split text to columns using delimiter " · " into two new columns: Job_Type and Job_Level.						
	8 no_of_employ	Validity: Employee count and Industry combined (e.g., "1-10 employees · IT Services").	Split text to columns using delimiter " · " into Company_Size and Industry. Cleaned " employees" string from size column.						
	9 location	Validity: City, State, and Country combined in one cell (e.g., "Delhi, Delhi, India").	Split text to columns using Comma delimiter. Retained relevant City/State column and removed redundant Country column.						
	10 posted_day_ago	Consistency: Mixed time units (hours, minutes, weeks) made sorting impossible.	Created Posted_Hours_Ago column. Converted all units to 'Hours' using nested IF logic (e.g., 1 day = 24 hours).						
	11 Hiring_person	Consistency: Names contained nicknames in parentheses (e.g., "John (Johnny) Doe").	Cleaned using regex formula: =TRIM(REGEXREPLACE(K2, "\s*(.*)", "")) to remove content inside parentheses.						
	12 alumni	Validity: Numeric count mixed with text (e.g., "27 company alumni").	Extracted numbers using formula: =IFERROR(VALUE(REGEXEXTRACT(J2, "[d+]+")), 0).						
	13 no_of_application	Validity: Some rows contained garbage text ('hours') due to column shift errors.	Cleaned using =IF(ISNUMBER(VALUE(I2)), I2, "Unknown") to filter out non-numeric garbage.						
	14 New Feature	Enrichment: No sector/category column existed for analysis.	Created Job_Sector using keyword mapping formula (REGEXMATCH) to group jobs into IT, Data, HR, Marketing, etc.						
Dataset Analysis & Key Insights									
- Sector Dominance: IT Engineering (31.3%) and Data Analytics (23.9%) control the majority of the market, totaling ~55% of all listings.									
- The "Fresher Gap": The market is heavily skewed toward experience. Mid-Senior roles account for 53.78%, while Entry-Level jobs make up only 2.05%, indicating a tough market for new graduates.									
- Work Mode Shift: Flexible work (Remote 35% + Hybrid 19%) has officially surpassed purely On-site roles (46%), marking a permanent shift in tech work culture.									
- Geographic Concentration: Hiring is hyper-localized. Karnataka and Maharashtra are the top hubs, followed by UP (Noida) and Delhi. Outside these top 5 regions, opportunities drop significantly.									
- Market Drivers: SMEs (Small & Medium Enterprises) are the volume drivers, posting ~80% of active jobs, challenging the notion that only "Big Tech" is hiring.									
Dashboard Properties & Design									
- Executive KPIs: Features 4 headline metrics (Total Opportunities, Total Demand, Avg Competition, Remote %) for instant decision-making.									
- Advanced Visualization: Uses Scatter Plots ("Competition Matrix") to correlate Brand Value (Followers) with Applicant Demand, identifying "Hidden Gem" companies.									
- Geospatial Intelligence: Includes a Geo-Chart/Bar Visual that isolates the Top 7 Hiring States, filtering out noise from low-volume regions.									
- Drill-Down Interactivity: Equipped with Slicers (Filters) for Job Sector and City, allowing users to dynamically slice data (e.g., "Show me only Remote jobs in Bangalore").									
- Strategic Layout: Follows a "General to Specific" flow—starting with high-level Market Volume and narrowing down to specific Job Titles and Company Tiers.
